The glutathione S-transferase (GST) of the mesophilic bacterium *Bacillus circulans* was purified to homogeneity as judged by SDS/PAGE. The purified enzyme has a molecular weight of 25.5 kDa and is composed of two non-identical subunits, alpha and beta, with Mr 18,500 and 18,200 respectively, as estimated by SDS-PAGE. Amino acid analysis of the alpha-subunit yielded a value of 879 (46.5%) for glycine and a value of 986 (49.3%) for cysteine, both with a free sulfhydryl group, compared with the

sum of these amino acids of 998 (49.9%) in the alpha-subunit of the typical alpha 2 class of GSTs from mammalian sources. By the results of sulfhydryl group titrations, we conclude that this purified enzyme is an alpha 2 class enzyme. Both isozymes have absorption maxima at 340 and 404 nm, and isoelectric points of 6.5 and 5.3 respectively. The alpha-subunit was found to have a high content of cysteine, which is rare in typical GSTs. It can be expressed in *Escherichia coli* with an N-terminal His-tag. The expression of ApoD was increased in both LX-2 cells and primary HSCs from patients with liver fibrosis. ApoD has been reported to modulate inflammatory responses, including its activity in the innate immune system. The induction of Apo
