Transparency AutoCAD 2006 supports transparency. It includes a new "Transparency Manager" feature, which allows setting up what is called a "transparency group". A transparency group is similar to a layer in other CAD applications. It is a way to group blocks together that need to be marked as transparent, such as walls in a building or a banner in a sign. Each transparency group can have its own color, line color, transparency level, etc. If a block has any transparency in it, it is assigned to the transparency group. There are no visible lines separating different transparency groups; each transparency group is a single, completely transparent layer. AutoCAD 2007 also includes 2D transparency. This was added to the newest release of AutoCAD to work with the 3D capability, but it is turned off by default. AutoCAD is able to store and display transparency groups and properties, as well as other objects that may be considered transparent, like levels, annotations, materials, and views. These objects are usually invisible, and instead, the user can use a special command to "activate" them. To access the transparency settings: select Transparency from the context-sensitive Help menu. The Transparency Manager dialog box will open. You can create and delete transparency groups, as well as customize their appearance. Miscellaneous AutoCAD 2007 also has an upgrade from previous releases that allows selection from lists. The new method has the ability to automatically sort based on the selected column. AutoCAD 2008 introduced the option to store XML comments for parts of the drawings. These XML comments are accessible to other products that use the drawing. The XML comments are typically for notes regarding the purpose of a certain drawing feature, and are not part of the drawing. The 2D Cloud Connect technology which is in AutoCAD 2012 was used by NASA to develop the Curiosity Mars Rover.
