I have Windows Server 2003 with SP1 installed. This server is not connected to any Active Directory, but I have a default user on this machine with non-administrative (regular user) access rights. Why does 'ls -l' still show extended attributes of files? A: By default the ls is set to use the ACLs (Access Control Lists). These ACLs describe the permissions for a directory. For example, an ACL may look like:

---

```
groups:S-1-1-0:r-x*r-x--- mask:r-x----- other_user:r-x-----
```

The groups:S-1-1-0:r-x\*r-x--- indicates that the user is a member of the guest group, which is restricted, allowing them to read the directory. The mask:r-x----- means that all files are viewable by the user. The other\_user:r-x----- means that no other user can read this directory.

Extended attributes can be shown with the -l parameter to ls: ls -l This shows the basic ACL as above, which is not quite the same as the "extended" ACL (which is listed in the first column below the basic ACL). You can use the ls parameter -c to show you the extended ACL.

As for why, these are a few possibilities: You have not changed the default for some services, like the file system service and the ls service. For more information about how to find the process ID for a given service, look

here. While you have the ACL\_SIZE\_EXCEEDED permission to read the ACLs, they are not visible. There are several permission levels which can cause this behavior, some of which can be seen here. // Copyright 2011 The Go Authors.
