Sometimes, your computer can perform faster if you change certain settings or processes. Unfortunately, you need to have a pretty good understanding of how your Windows system works. A reliable software solution, such as Windows Utility can help you improve your system without requiring additional programming skills. The application gathers information about your system, then displays you some solutions for improving the speed of your system and how it responds to certain programs. You can see details about your machine, as the program displays them, such as computer name, disk drives, display, peripherals, adapters, USB devices, media files or processor. Windows Utility allows you to create shell association, in order to easily access certain files and executables. This way, you can launch files directly from the context menu, increasing file accessibility and responsiveness, comparing with the standard "Send to" right-click menu. Besides, you can perform various system tweaks on the spot, in order to optimize the memory usage and CPU performance. You can stop certain processes that keep your computer from running at optimal performance, or remove certain startup programs that cause your computer to malfunction or work slower than normal. Furthermore, you can use the program as a Task Manager replacement, as the application will display you all the currently active processes, giving you the possibility to suspend or terminate them. In addition, Windows Utility can replace several other system tools, such as Add or Remove Programs or System Startup. Using them, you have the possibility to access all your systems major tools and utilities in a single tool, uniting them under one application. This way, you do not have to browse all your system to access each one separately. Windows Utility 1.0; 1) Create Shell Association. Q: How to store multiple values in a variable when the values are obtained by parsing a file? I am trying to store two values in a variable when the values are obtained after parsing a file. For instance, suppose i have a file data.txt and i want to store two string data in a variable. I want to avoid hard coding the data in the variable. I have tried the following :- #include #include #include using namespace std; const string FILENAME = "data.txt"; int main() { string test[2] ; ifstream FileStream; FileStream.open(FILENAME); if (!FileStream) { cout > temp; test[1] = temp ; cout > test[i]; or a much simple way: std::ifstream file("data.txt"); std::vector
