When I try to use the code from Google in my Django view like this: response,content = curl.request('') I receive an error saying that this view needs to be listed in my urls.py module, but the code below is listed in my urls.py. from django.conf.urls.defaults import patterns, include, url from django.contrib import admin admin.autodiscover() from users.views import user_detail urlpatterns = patterns('', # Login Page url(r'^login/', 'auth_views.login', name='login'), # Map User List url(r'^map/','maps.views.user_list', name='user_list'), url(r'^map/','maps.views.map_view', name='map'),) Is there a better way to go about accessing this URL link, or is this the problem? A: You don't need the @login_required decorator for your view in your URL configuration. You need to be logged in for the login view and it will redirect to the map view. from django.urls import path from .views import MapView urlpatterns = [# Login Page path('login/', MapView.as_view()), # Map User List path('map/', MapView.as_view()), # other views...] Tag: Tomahawk Do you have any problem with rocket fuel leaking into the sky above you? What if that rocket fuel were military grade and had a non-stop flight path that would easily give you no way of escape. Thats what Tomahawk cruise missiles are capable of doing. Not only that, but what if the cruise missile were capable of carrying up to a ton of explosives or even a nuclear warhead? For the price of ten Carrier Vectors full of missiles you could get about 1,300 cruise missiles armed to the teeth. An attack on any part of Iraq with Tomahawk cruise missiles has the potential to be very

krrish3fullhd720pmoviedownload Docker is the World's leading container platform and we're excited to work with the Docker community to build a world-class platform that solves the problem of how to run software in lightweight, virtualized containers on any cloud or server. You can download the docker-latest binary (v1.8) directly from docker.io. All the latest docker releases (as below) can be downloaded from our binary archive page which will build a container binary for your OS and cpu architecture. Please make sure your first step after reading this documentation is to read the Introduction to Docker. Questions? Note to new users on Windows: To start working with Docker, you must first download and install Docker Toolbox. Download Docker Toolbox Now To start using Docker for Windows, you need to download the Docker application to your local machine. Next, you need to install Docker for Windows. To do that, launch the Docker executable that you downloaded earlier. You'll then have to log in and choose create a new user or use an existing one from the Docker desktop. The installer will then walk you through the process of creating a new user. Once the new user is created, you'll need to connect your local machine to the Docker Hub. Click the Settings button and you'll see the Docker Hub section. You'll need to upload your public key to the remote Docker Hub server. You'll then want to select the Linux-based OS to use on your Docker host. When you do that, you'll be able to select the Linux distribution that you'd like your application to run on. Last, you want to enter your Docker hostname and a password for your local user. To do that, click the gear icon next to the dockerhostname and you'll get the details screen for Docker. NOTE: Docker is not focused on providing great tooling for different operating systems. Most Docker users can run all the apps and runtimes of their choice on the same host. This guide is for Windows users, so we're going to run our docker host on Windows 10. Installing Docker Toolbox Docker Toolbox is a web-based Docker client that you can use to manage your Docker hosts and your Docker images. To install Docker Toolbox, open a web browser and go to Log in with your Docker ID and click Install Docker. When you click the OK button, Docker Toolbox will download 6d1f23a050
