An A/D converter circuit, which converts an analog voltage or current into a digital value, is known. There are various kinds of A/D converters, and here the principle of an A/D converter using a reference voltage will be explained. A comparator is provided between an input terminal and a reference voltage terminal to compare the input voltage with the reference voltage. The comparator outputs a voltage value corresponding to the output result of the comparison. The voltage value output from the comparator is subjected to a digital-to-analog (D/A) converter to output a digital value corresponding to the voltage value. The digital value output from the D/A converter is connected to an external circuit. The A/D converter circuit of this configuration is arranged as shown in FIG. 1. In FIG. 1, an A/D converter circuit (circuit 1) is composed of a voltage-to-current converter 2 which converts a given voltage to a current; a current-to-voltage converter 3 which converts the current to a voltage; and an amplifier 4 which is composed of a differential amplifier having the input side of the current-to-voltage converter 3 as an input and the output side as an output. The output side of the amplifier 4 is connected to a comparator 5. The reference voltage 6 is applied to the positive input of the comparator 5. The voltage value output from the comparator 5 is applied to a D/A converter 7 to be converted to a digital value. The digital value is applied to a drive circuit 8 for a constant current source or drive circuit 9 for the differential amplifier 4. The above A/D converter circuit 1 is based on the configuration wherein the input voltage V_{in} is compared with the reference voltage V_{ref} , and output as a digital value. That is, in order to obtain the input voltage V_{in} , the differential amplifier 4 is driven
